
NewBlue Film Effects: How to use it for free...

Now, I do not agree with going out and searching for keygens to unlock software that people deserve to get paid for. However, I'm also not the type of person if a gas attendant gives me a couple of gallons of gas more without charge.

NewBlue Film Effects is an incredible plug-in for Sony Vegas and Adobe After Effects. I've recently downloaded it to try out for a film project and loaded it into Vegas. To my surprise, the watermark did not show up. Confused, I double checked to make sure they didn't give me the wrong file. Nope, it was the trial version.

Apparently, with how I have my properties on Vegas: resolution: 1128x480, square aspect, and preview at BEST: FULL, the watermark does not show up.

So hell, all the Vegas users out there, if you want to save a couple hundred dollars on a software then download the trial of NewBlue FX and read my topic "Vegas Users: The correct ration for preview" in the Indie Gearhead section.

You'll be able to use their FX without paying for it.

What's the filter look like DW? Also, where's your blog for Echoes? I can't see it anywhere on your site anymore and I thought you were taking a short break on it.

It's probably not visible until you render.

It would be cool though. That's what happens when coders make a mistake. They should have tested better. (If it does screw up like that)

Either way, thanks for sharing. Sony Vegas is, IMHO, the best editor out there. Even a novice can do some high quality editing. No in-out cuts, just drag,drop and resize.

Now, that won't help someone develop good story telling technique but it's a start.

Its not visible even after the render. Its probably the best bug in the world. :)
